

It really does place a call

One interface, two carriers. The demo uses the one that does not bill per minute.

WHAT THE DEMO USES

A handset on our own wifi

The phone loads the call screen and waits to be rung. Costs nothing, needs no account, and everything after "hello" is the real pipeline.

WHAT A SITE WOULD USE

An actual telephone

The carrier path is written and switched on with one setting. We left it off: a live call bills by the minute, and it proves nothing the other column does not.

It refuses to dial a number that could belong to a real person.

Only 555-0100 to 555-0199 is reserved as permanently unassignable, so every other number is rejected unless someone deliberately says otherwise. Switching carrier is one variable; a wrong number should not be one typo.
