

ReconMed

Automated Medicine Reconciliation

Reconciled before the visit.

Pre-visit concomitant medication
reconciliation for clinical trial sites.

HackMIT 2026

The medication list is stale, and the visit is now

Twelve weeks of changes, recalled once, in the last twenty minutes of a visit.

Conmeds are entered at the visit, so the record is whatever the participant remembers.

Nothing above reaches the site any other way. A course that ended six weeks ago is the easiest thing in the world to forget.

By Phase III, one participant in three has a protocol deviation

187 protocols from 20 sponsors and CROs — Tufts CSDD, 2022

Getz et al., *Therapeutic Innovation & Regulatory Science* 56:632–636, 2022. All deviation types, not medication-specific.

The same error, found later, costs \$4,862

Retrospective verification of one phase 2 trial — I-SPY COVID, 2025

All of that verification found errors in 0.36% of the fields it checked.

Checking everything late is the expensive way to learn almost nothing. Catching it on the call is the cheap way.

Communications Medicine 5, 2025 · 333 of 1,111 patients, 10,101 of 44,486 eCRFs verified.

Ask days before, not minutes before

Stop

3 min to review

not to write up

4 h 30 back, every round

Calling participants between visits already works

25,829 pharmacist calls across 12 clinical trials — Martinez et al., 2017

45.5%

of those calls produced at least one intervention

Around 55% were rated high-impact — affecting trial outcomes or adherence.

Participants with an issue found by phone

adverse events

medication use against protocol

concurrent medications

A pharmacist made every one of those calls.

That is why it is not standard practice. ReconMed makes the call, and a coordinator reviews only what it found.

Martinez et al., *Clinical Therapeutics* 39(3), 2017. 3,873 participants; 12 trials in type 2 diabetes.

The agent proposes. A coordinator decides.

the medication log is written only on Promote, under an electronic signature

Two models, because a realtime agent cannot wait

The Talker speaks. The Thinker plans between turns and never touches the line.

Every claim resolves to a lookup

Deepgram nova-3 in, aura-2 out · GPT-5.6 Luna both sides · prompts are files, swappable without a deploy

The model is not the source of truth
