

What we do about privacy

A call about someone's medication is as sensitive as data gets. Three places it could leak; three answers.

THE VOICE

Their recorded voice need never reach a vendor

Speech in and speech out
run on open models,
on this machine's CPU.

No API key, no upload, no account.

THE RECORD

Every store sits on the site's own machine

- the trial's medication log
- the call in progress
- the drug reference
- plain-language guidance

Or point it at the sponsor's server: one setting, same code.

THE NAMES

They never enter the record at all

The call hears a name
and a date of birth. The
trial record keeps neither.

Both are stripped as the
call is filed, leaving the
subject number.

The demo runs hosted speech for latency; the local models are built and tested, and switching is a setting rather than a rewrite.

Three real published protocols, 25 participants — the trials are real, every participant is synthetic.
